School of Mathematics, Statistics and Data Science

Sungshin Women's University

1 Introduction

2 Penalize Regression Method

3 Algorithms

4 R Package

- A decision tree is a predictive model that splits the input space into regions using simple decision rules.

1 Introduction

2 Penalize Regression Method

3 Algorithms

4 R Package

- A decision tree is a predictive model that splits the input space into regions using simple decision rules.

- A decision tree is a predictive model that splits the input space into regions using simple decision rules.

- A decision tree is a predictive model that splits the input space into regions using simple decision rules.

- A decision tree is a predictive model that splits the input space into regions using simple decision rules.

- A decision tree is a predictive model that splits the input space into regions using simple decision rules.

3 Algorithms

4 R Package

```
sq.loss <- function(y) {  
  y.bar <- mean(y)  
  sum((y - y.bar)^2)  
}
```

- We construct the following procedure for regression, where we apply a loss measure `sq.loss` function to the argument `branch` function.

Q & A

Thank you :)
